

Why I want to go to space

As I stand and view a sky filled with numerous stars, I have a strong feeling of wonder. I am interested in the enormous universe above me, and I desire to comprehend and explore it. I have been interested in the universe and its mysteries, such as moving galaxies and planets and free movement of stars, for as long as I can remember. I have pursued my curiosity about life and pursued a dream, one that many believe is unachievable, but for me, it is the perfect path for me to explore the universe.

I developed an interest in technology and science when I grew up. I, an African, pursued a career path that not many have pursued, and I have struggled to make my dream a reality. As I kept studying about space, I desired to learn about astronauts such as Neil Armstrong and Sally Ride, who encountered the unknown, and my role model, Jessica Watkins. Not only did I draw motivation from them, but I desired to become a space explorer too. I have encountered obstacles in my studies, attempting to excel in subjects such as mathematics, physics, and computer studies, ones that I believe will make me an astronaut, even though I have not received a lot of information and resources, as it was just something different which my parents never understood or look in to it.

Even though I work diligently and care a lot, my path hasn't been an easy one. I have encountered obstacles that challenged my character, such as school and lack of confidence in my capabilities, and I have encountered personal obstacles that almost derailed me in my quest to make my dream a reality. Nevertheless, I refused to allow obstacles to hinder me. Instead, I utilized my inner fortitude, will, and healing capabilities to navigate through challenging times. I struggled, but I have teacher a and role models who encouraged and guided me, and I kept my eyes focused. With will and work, I have conquered many

obstacles, becoming a strong, capable, and even more determined individual to make my dream a reality and explore outer space.
